

# Environment & Ecology

## Unit-1 (Environment)

### # Environment :-

the term environment means surrounding in which the organism. the term environment derived from Greek word that means "covered from all sides".

### # Environmental Study :-

the brief description of environment is called environmental study.

Environment create favorable condition for the existence and development of living organism.

### # types of environment :-

Environment can be classified into two parts -

- a) Natural environment
- b) Man-made environment (anthropogenic environment)

#### a) Natural environment :-

The environment that comes into existence without influence of man is called natural environment it operates through self regulating mechanism called homeostatic environment.

Date.....

## b) Man-Made environment :-

The environment which has been modified by human activities is called man-made environment.

Human modify the environment according to their own needs and ways without taking into account its consequences.

## # Components of Environment :-

The environment is classified into two components -

- 1.) Biotic components (living)
- 2.) Abiotic components (non-living)

### i) Biotic components :-

It is composed of all living components like - plants, animals, human, microorganism.

Biotic components also classified into three categories:

- i) Producers or Autotrophs
- ii) Consumers
- iii) Decomposers

### i) Producers or Autotrophs :-

Producers are also called autotrophs. Auto means self and trophs means feeder that means self feeder.

Ex → plants make their own food by the process of photosynthesis.

### ii) Consumers :-

Consumers are also called heterotrophs. Hetero means other and trophs means feeder that means other feeder.

Ex → Animals, Human Being.

### iii) Decomposers :-

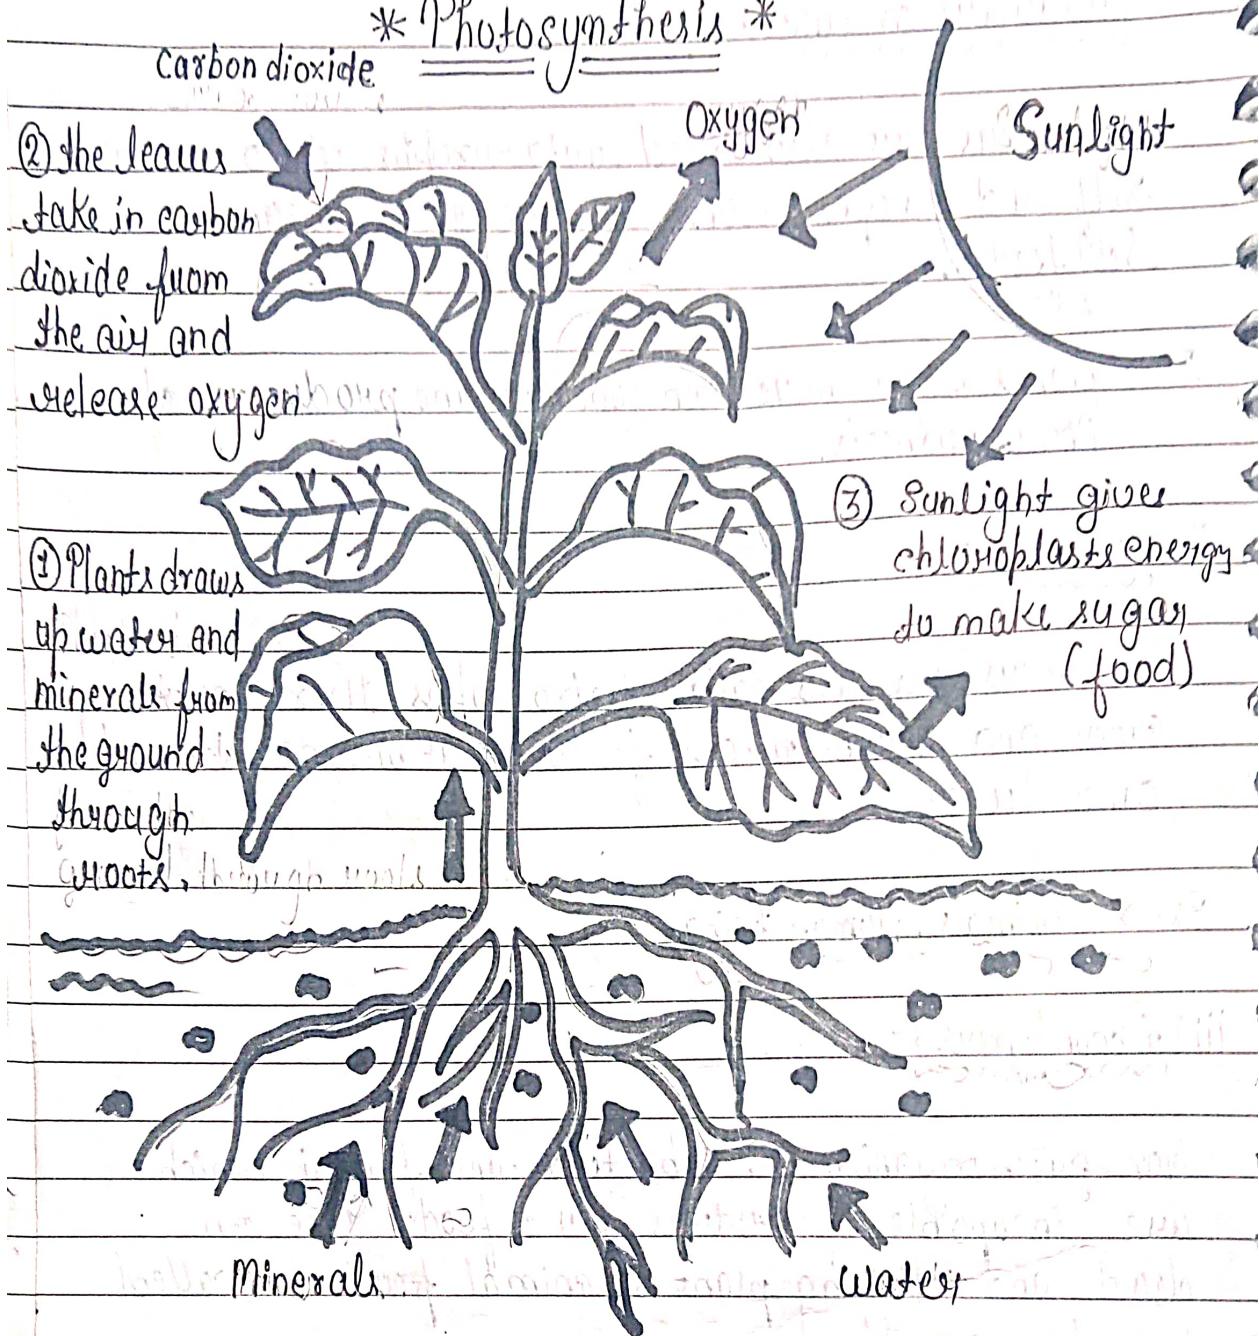

Non-green organism like bacteria and fungi which are incapable of producing their food. Live on dead and decaying plant or animal part are called decomposers.

### 2.) Abiotic components :-

It is composed of external physical factors like - temperature, humidity, water, minerals and gases.

Date.....

## \* Photosynthesis \*

## (PHOTOSYNTHESIS)

Photosynthesis is a process used by plants and other organisms to convert light energy into chemical energy that, through cellular respiration, can later be released to fuel the organism's activities. Some of this chemical energy is stored.

Date.....

5

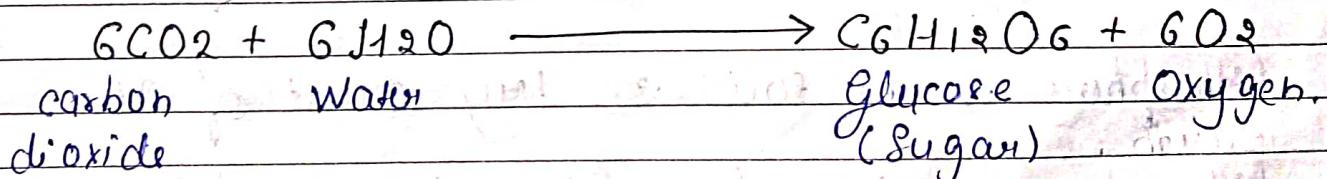

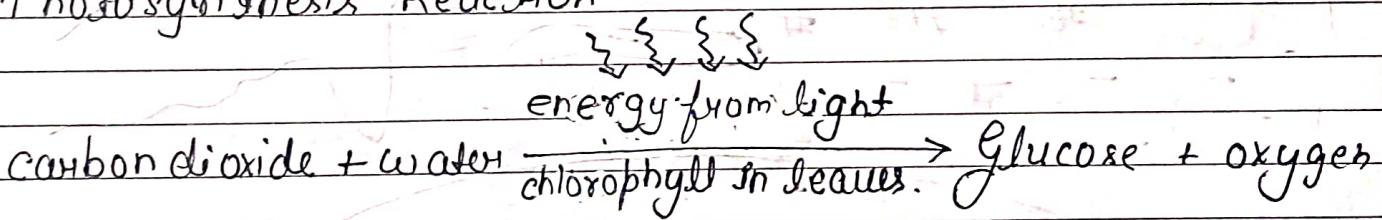

carbohydrate molecule such as sugar and starch which are synthesized from carbon dioxide and water.

Photosynthesis word come from Greek word photo (phōs) means "light" and Synthesis means "putting together" that means light putting together.

Most plants algae and cyanobacteria perform photosynthesis; such organisms are called photoautotrophs.

Photosynthesis is largely responsible for producing and maintaining the oxygen content of the earth's atmosphere, and supplies most of the energy necessary for life on earth.

→ Photosynthesis Reaction -

~~Starch~~ (Starch)

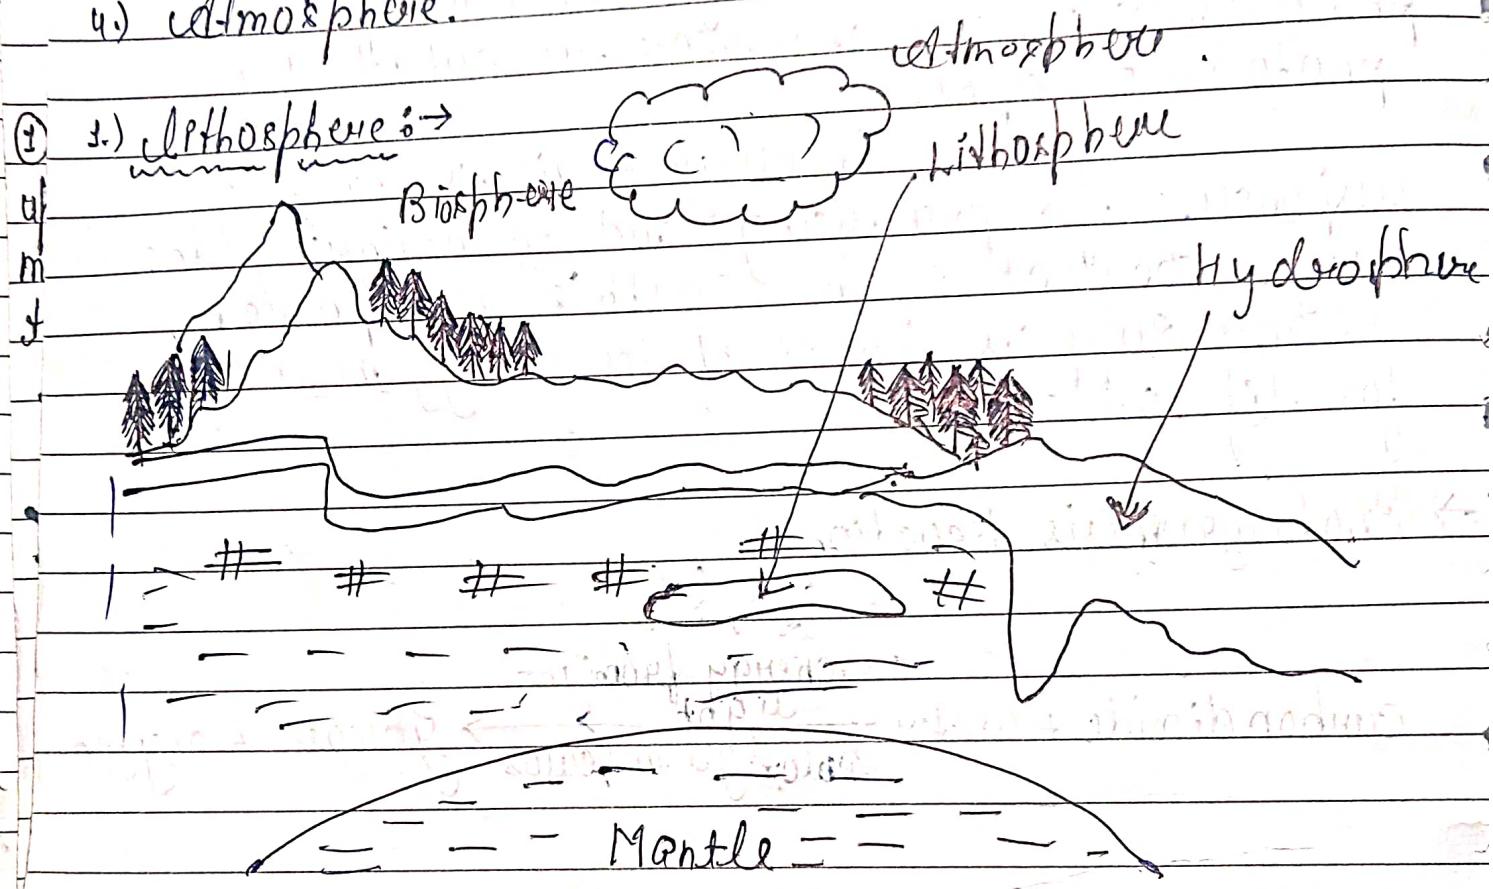

~~Digestive enzymes~~ ~~amylase~~ ~~is found in~~  
~~saliva~~ ~~liver~~ ~~pancreas~~ ~~and~~ ~~small~~ ~~intestine~~

Date.....

## \* Segments of environment:-

② the environment consist of four segments-

- 1.) Aethosphere
- 2.) Hydrosphere.
- 3.) Biosphere.
- 4.) Atmosphere.

Lithosphere is the solid or dry part of the earth.

Lithosphere consist of complex mixture of inorganic organic, minerals, air and water. Soil is the store & house of minerals conserve of soil producer of crops home of wild life.

Date.....

## 2) Hydrosphere :-

The water mantle of earth is present in oceans, sea, lakes, ponds, rivers, ground etc. Earth is called blue planet because of 80% it's surface covered by water.

## 3) Biosphere :-

Biosphere is the region of earth where life exist. Biosphere covers the living organism and there interaction with the environment.

## 4) Atmosphere :-

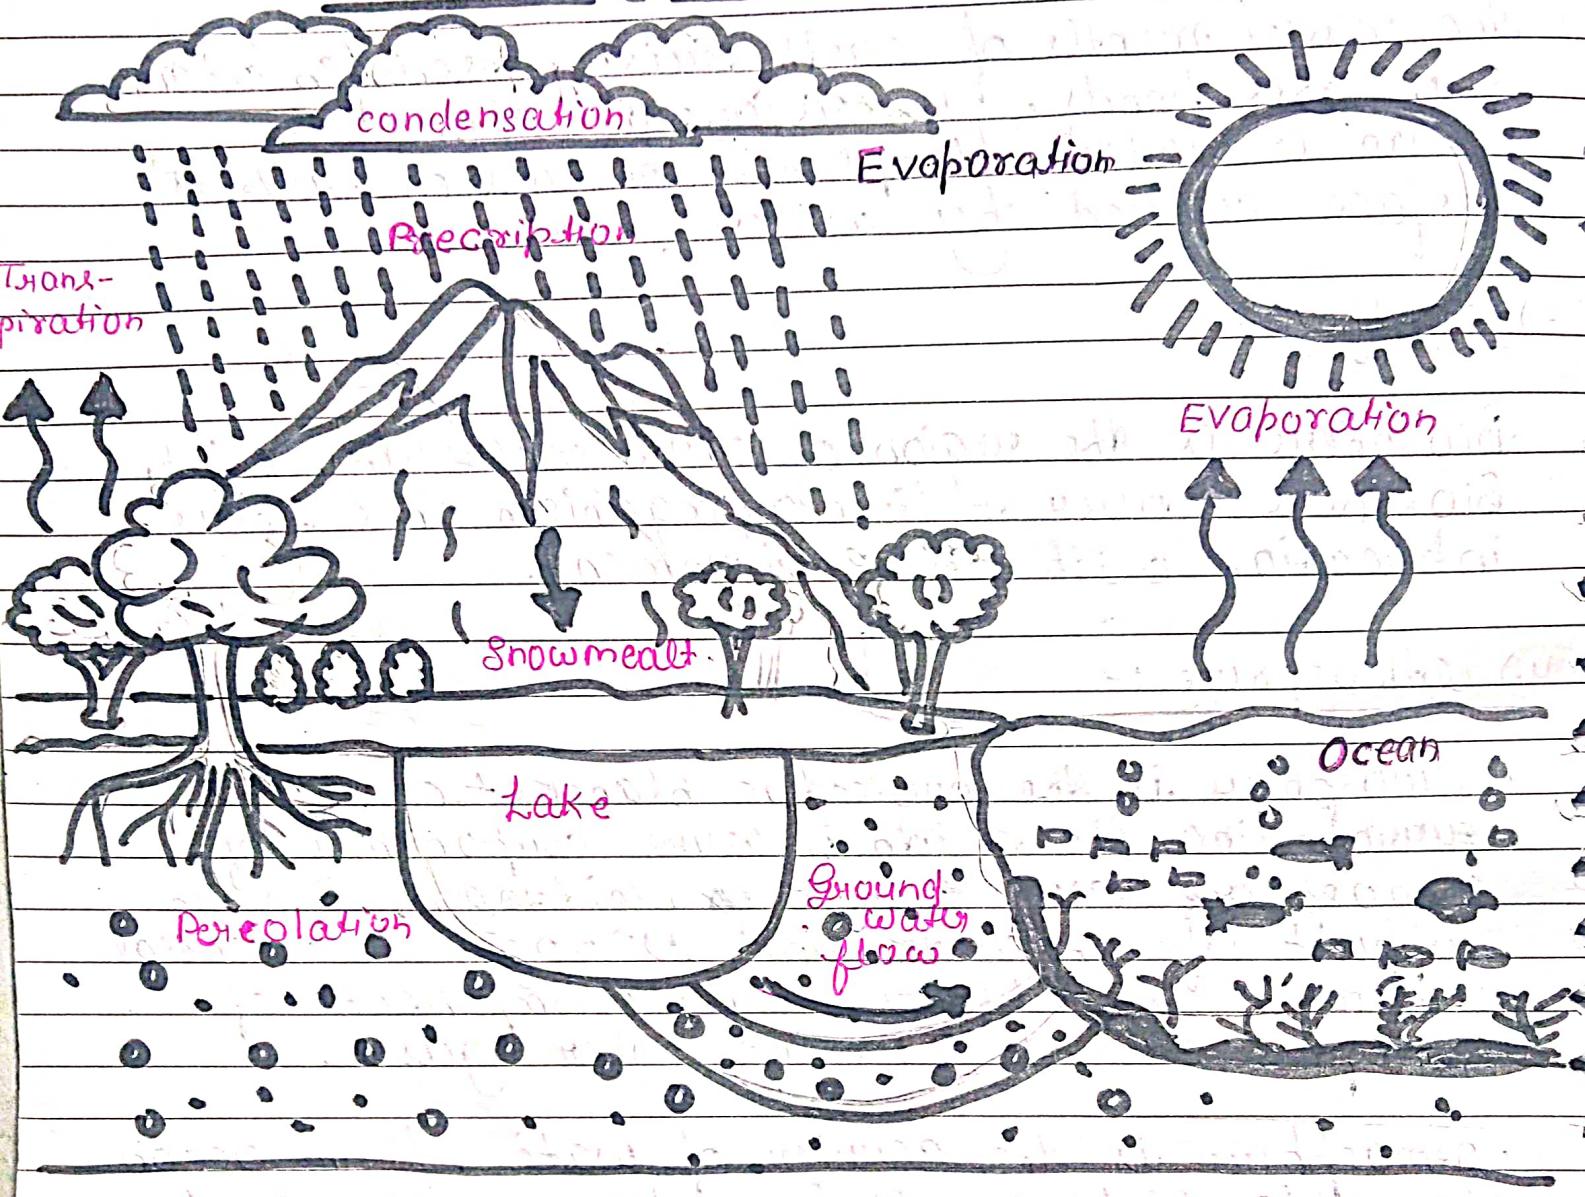

Atmosphere is the protective blanket of gases surrounding the earth. Major components of atmospheric air are oxygen, nitrogen, Oxygen supports life on earth and Nitrogen is essential nutrient for plants. minor components of atmosphere are CO<sub>2</sub>, and other gases.

Atmosphere is the carrier of water from ocean to land by a cycle known as hydrological cycle or water cycle.

Date.....

8

## \* Water Cycle or hydrologic cycle \*

The water cycle, also known as the hydrologic cycle or the hydrological cycle, is a biogeochemical cycle that describes the continuous movement of water on, above and below the surface of the earth. The mass of water on earth ~~remains~~ fairly constant over time but the partitioning

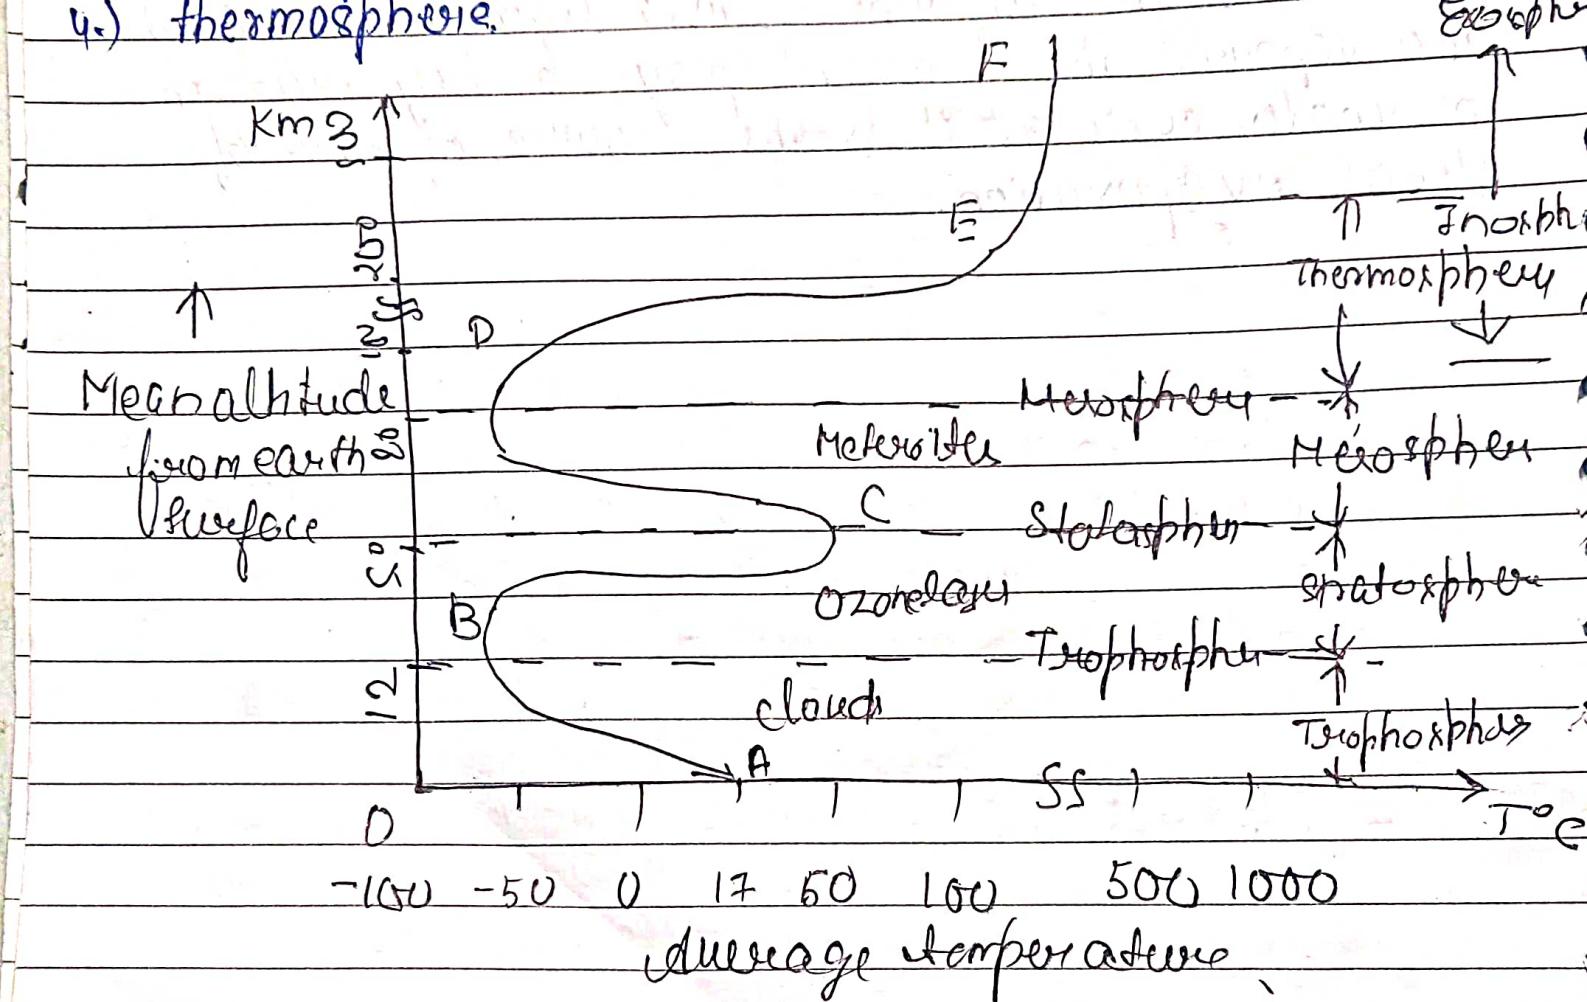

Date.....

of the water into the major reservoirs of ice, fresh water, saline water (salt water) and atmospheric water is variable depending on a wide range of climate variables. The water moves from one reservoir to another, such as from river to ocean, or from the ocean to the atmosphere, by the physical processes of evaporation, transpiration, condensation, precipitation, infiltration, surface runoff, and subsurface flow. In doing so, the water goes through different forms; liquid, solid (ice) and vapour. The ocean plays a key role in the water cycle as it is the source of 86% of global evaporation.

## \* Structure of atmosphere :-

The structure of atmosphere is divided into four zone / parts / layer.

- 1.) troposphere
- 2.) stratosphere
- 3.) mesosphere.
- 4.) thermosphere.

## 1) Troposphere:-

It is most dense and contains about 75% of total atmospheric mass.

Date.....

Average altitude of 12 km from earth surface.

## 2) Stratosphere :-

Main activity in this zone is absorption of ultra violet radiation by ozone. It's average altitude of 50 km from earth surface.

## 3) Over the thermosphere :-

Main activity in this region is the high kinetic energy of gas molecules. It's average altitude of ~~earth to 80 km~~ 400 km from earth surface.

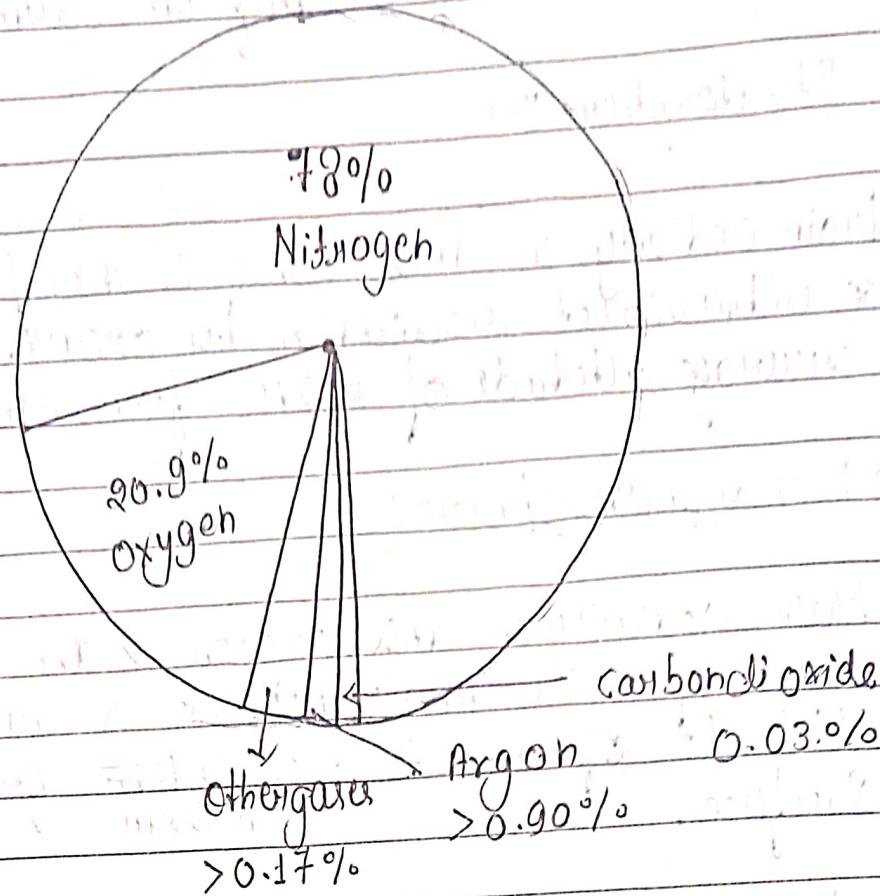

## 4.) Mesosphere :-

Main activity in this region is burning of meteorites. It's average altitude of 80 km from earth surface.

## \* Composition of atmosphere :-

Our atmosphere comprises of many gases and water vapour it is called air.

Date.....

- The atmosphere is made up of different type gases, water vapour and dust particle.
- The composition of the atmosphere is not static and it changes according to the time and place.

#### - Permanent gases of the atmosphere -

Constituent	Percentage by Volume	Concentration (PPM)
Nitrogen ( $N_2$ )	78.084%	780,840
Oxygen ( $O_2$ )	20.946%	209,460
Argon (Ar)	0.934%	9,340
Carbon dioxide ( $CO_2$ )	0.036%	360
Neon ( $Ne$ )	0.00182%	18.2

Date.....

13

Helium (He)	0.000524	5.24
Krypton (Kr)	0.000114	1.14
Hydrogen (H <sub>2</sub> )	0.00005	0.5

- The atmosphere is mixture of different types of gases.
- Nitrogen and oxygen are the two main gases in the atmosphere. It is made and 99 % of the atmosphere is made up of these two gases.
- Other gases like argon, carbon dioxide, neon, helium, hydrogen, etc. form the remaining part of the atmosphere.
- The position of the gases changes in the higher layers of the atmosphere in such a way that oxygen will be almost negligible quantity at the heights of 120 km.
- Similarly, carbon dioxide (and water vapour) is found only up to 90 km from the surface of the earth.

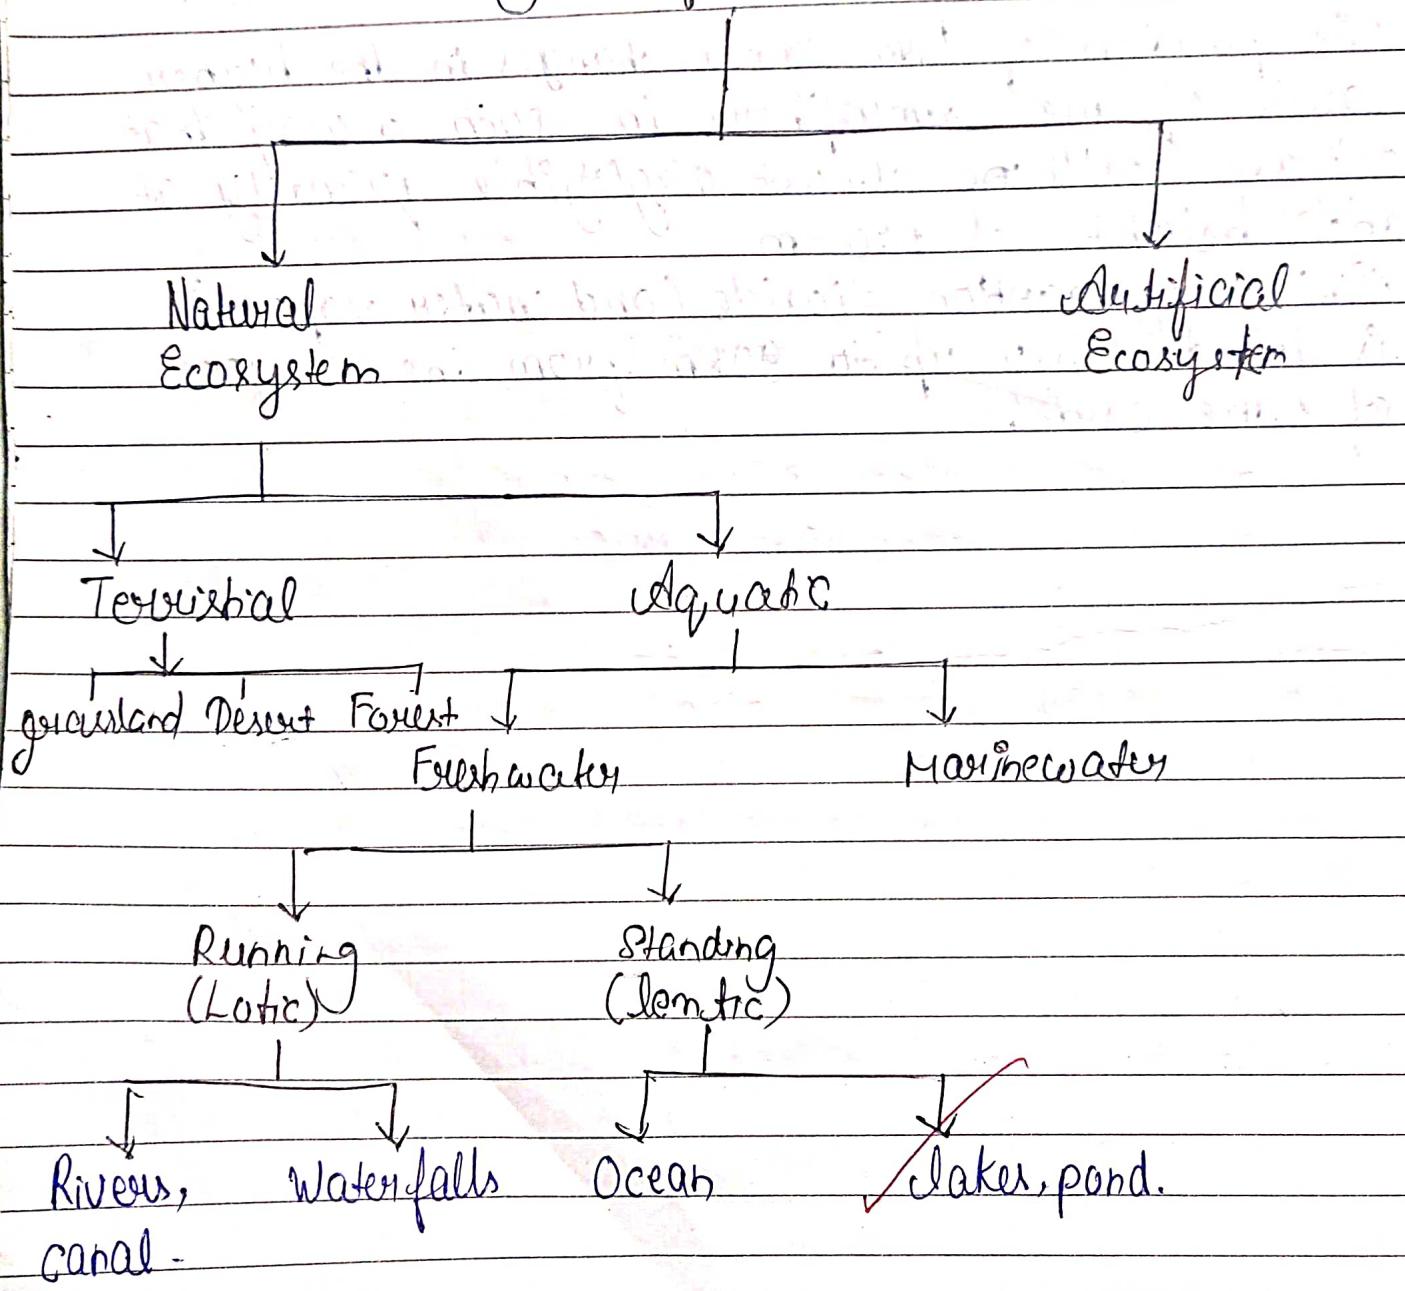

Date: 10/Nov/2022

## Ecosystem

The term ecosystem describe both the living and non living components of an area that interact with each other.

"The term ecosystem was given by Arthur Tansley in 1935."

### Types of Ecosystem

Date.....

### 1.) Natural eco-system:-

These eco-system that occur naturally and can survive without any intervention from human beings -

Natural eco-system divided into two parts -

(A) Terrestrial eco-system -

(B) Aquatic eco-system -

(A) Terrestrial eco-system :-

Terrestrial eco-system are of three types - forest, desert and grassland.

(a.) Forest eco-system :-

The forest cover a big area on earth they are of different types - some forest are dense, some are have too many wild animals; some have tall trees, some have shrubs.

Depending on the climatic condition, rainfall, temperature and other factors there are several kind of forest - eco-system.

(i) Tropical - rain - forest - eco - system

(ii) Tropical - seasonal - forest - eco - system

(iii) Temperate - forest - eco - system

(iv) Boreal - forest - eco - system.

Date.....

### (i) Tropical - rain - forest - eco - system : →

Such forest are located in central America, Congo river basin of Africa, where the rainfall is high these forest have following features.

- (i) Broad leaf and tall plants
- (ii) Warm and humid climate
- (iii) High diversity of tree species.

### (ii) Tropical - seasonal - forest - eco - system : →

Such forest are located in plates of Africa, south east Asia, Australia and some part of India where the rainfall is seasonal. These forest have following features

- (i) dry and wet season alternate each other.
- (ii) warm climate.

### (iii) Temperate forest - eco - system : →

Such forest are found in Asia and USA, north central Europe. Average annual temperature is not more than  $20^{\circ}$ .

- (i) Dominance of hard wood trees which are suitable for quality furniture and building purpose.

#### (iv) Boreal-forest-eco-system: →

Such forest are found across east-west Band of North Europe, North-Asia and North America. These forest have following features.

- (i) cold climate due to high altitudes and high latitudes.
- (ii) Dominated by conifers which are important source for making paper, pulp and lumber.

#### (b) Desert eco-system:-

Desert refers to an area in which the rainfall is negligible. In them the days are hot and the night are cold. These desert have following features -

- (i) climate is generally dry
- (ii) there is scarcity of water.
- (iii) Scanty flowering and flora.

#### (c) Grassland eco-system:-

Based on the type of major vegetation, Grassland eco-system is a ~~terrestrial~~ type-eco-system. The rainfall is usually seasonal and temperatures are moderate. These eco-system have following features.

- (i) Climate is neither too dry nor too moist.
- (ii) Vegetation is of flowering plants, shrubs & tall grasses.

### (B) Aquatic Eco-system:-

An aquatic eco-system is an eco-system formed by surrounding a body of water. Aquatic eco-system contains community of organisms that are dependent on each other and on their environment.

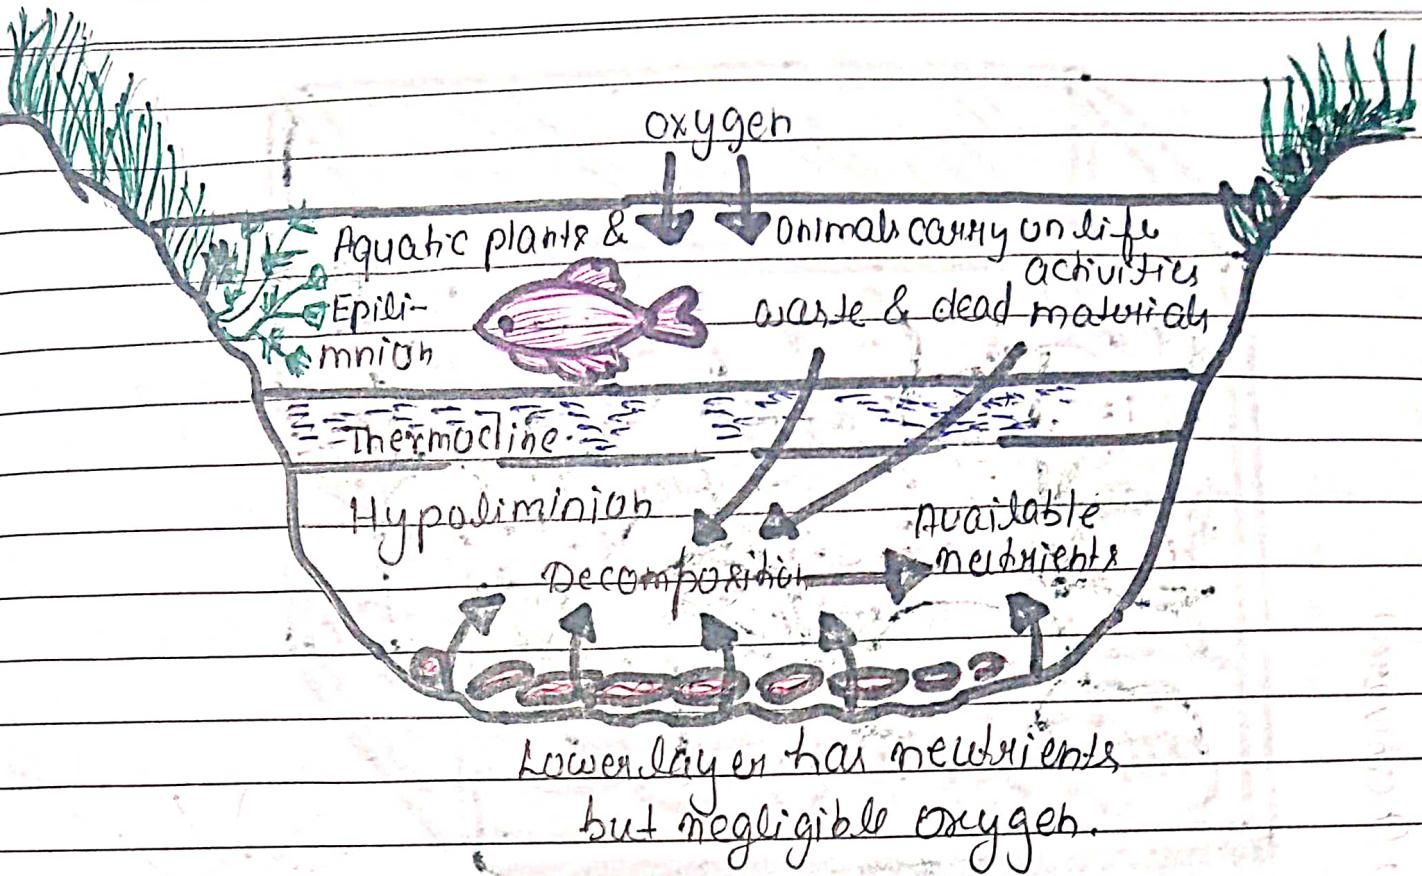

They are classified into two categories -

- (a) fresh water,
- (b) Marine water.

#### (a) Fresh water →

##### (i) Lake eco-system :-

A lake is a stationary fresh water aquatic eco-system. The water in lake comes from rain, snow melting, ice and streams. Its depth varies from 395m (1300 feet) below sea level.

### (ii) Pond - eco - system :-

A pond is a stationary fresh water aquatic eco-system. It may be a natural pond or man-made pond.

A pond eco-system is a community of organism that live in a pond.

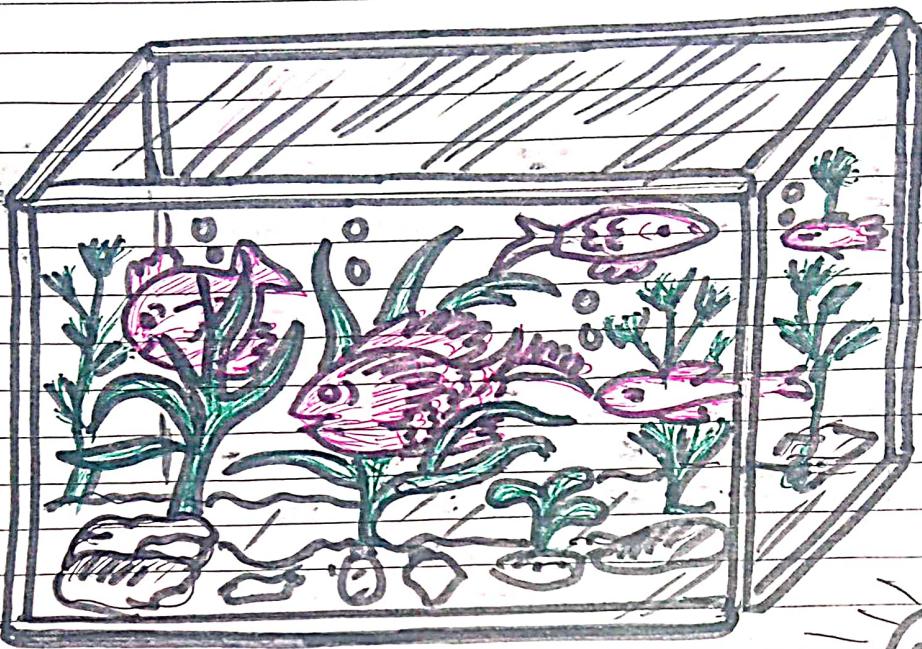

In aquarium an example of artificial ponds

Biotic and Abiotic elements are found in pond.

**NOTE:-** An aquarium is a glass container in which filled with water.

(iii) River eco-system: - ~~but it is not a river system~~  
flowing.

Rivers are the best example of fresh water aquatic eco-system.

They play an important role in transporting the materials from land to sea (ocean). There are two types of rivers.

(a) perennial river (b) Non-perennial river.

(a) perennial river:-

The perennial rivers are the rivers that continue to flow throughout the year.

Ex → Ganga, Yamuna, Brahmaputra, Kaveri.

(b) Non-perennial river:-

Seasonal rivers that flow during rainy season only.

Ex → Mahanadi, Krishna, Narmada.

(iv) Ocean-eco-system:-

An Ocean is a huge body of salty water that extends over almost an infinite large area.

It covers about 70% of the earth's surface.

Date.....

There are five ocean on the earth.

- (a) Pacific Ocean
- (b) Atlantic Ocean
- (c) Indian Ocean
- (d) Arctic Ocean
- (e) Antarctic Ocean

### \* Structure of eco-system :-

In eco-system is composed of two main major components.

A) biotic components

B) Abiotic components

The study of structure of an eco-system two knowing the following details-

- (i) The quantity of non-living organism and their distribution in an eco-system.
- (ii) condition of existence of living organism such as temperature, humidity, light air, soil, water etc.

Date.....

## Structure of eco-system

### \* functions of eco-system:-

(i) to manufacture food

(ii) flow of energy

(iii) It controls the material cycle.

Date.....

## (FOOD CHAIN)

The transfer of food energy occur in repeated stage in which it is being eaten by a series of organism.

This sequence of eating and being eaten turned as food chain.

plant → Grasshopper → frog → snake → Hawk.

food chain are two types -

- (i) Grazing food chain -
- (ii) Detritus food chain -

(i) Grazing food chain -

Here the green plants are being consumed by animal.

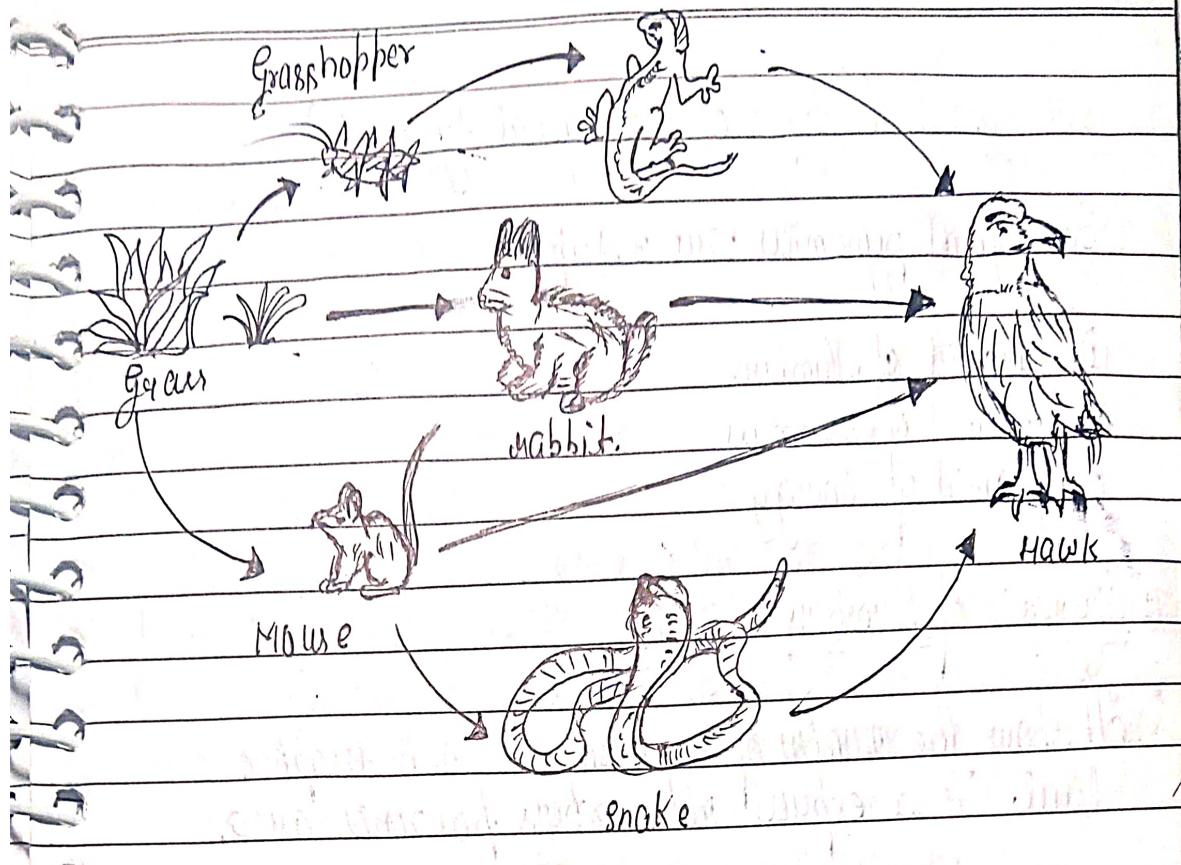

(ii) Detritus food-chain -

The dead organism matter is being consumed by bacteria, etc.

## (FOOD WEB)

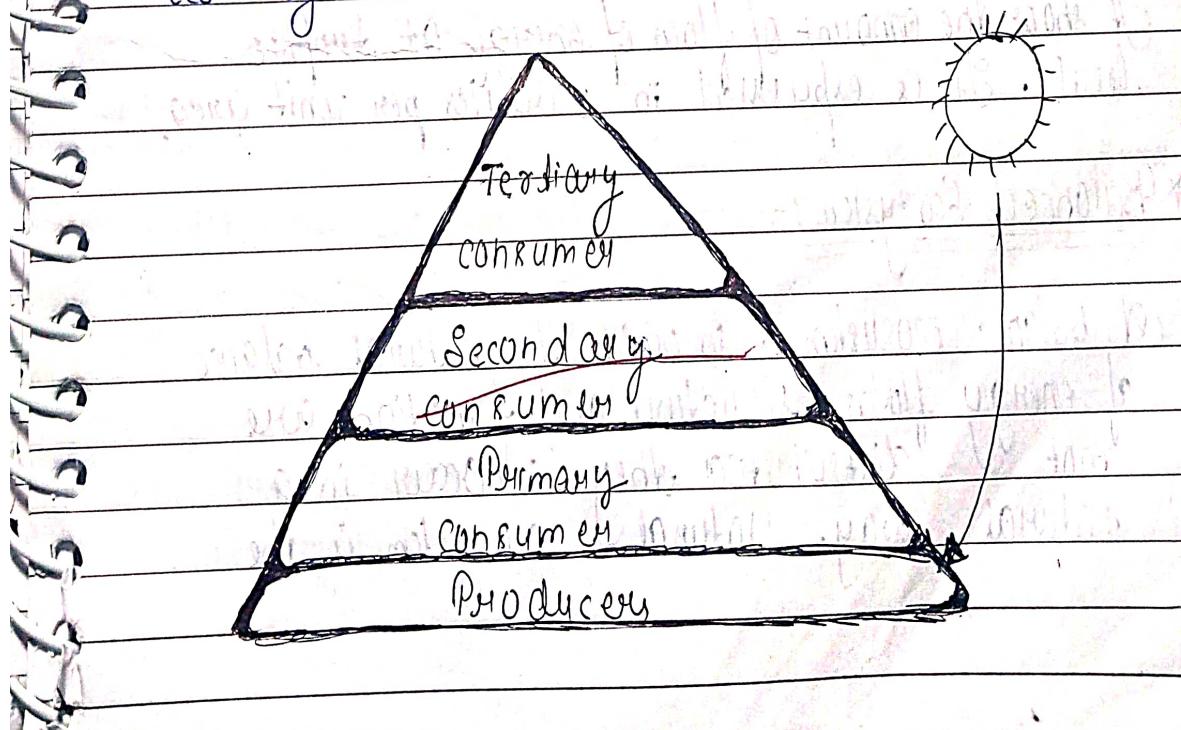

Food chains are interconnected through different types of organism. This interconnection is called a food web.

Lizard. Date.....

### (Ecological Pyramids)

An ecological pyramid is graphical representation showing the relationship between different organism in an ecosystem. It show the flow of energy at different trophic levels in eco-system.

Date.....

## (Types of Ecological Pyramids)

Ecological pyramids are 3 types -

- ① Pyramid of Numbers
- ② Pyramid of Biomass
- ③ Pyramid of energy

### (1) Pyramid of Numbers:-

It shows the number of organism at each trophic level. It is expressed in numbers per unit area.

### (2) Pyramid of Biomass:-

It shows the total weight of total amount of living matter. It is expressed in gram per unit area.

### (3) Pyramid of energy:-

It shows the amount of flow of energy at trophic level. It is expressed in Calories per unit area.

### \* Balanced Ecosystem :-

A balanced ecosystem is in which the natural balance of energy flows, structure and function are not disturbed they occur in a natural way. Natural ecosystem is the

Date.....

under natural condition without any external interference.

### ★ Effect of Human activity:-

→ Food :- To keep a body alive, the process of metabolism occurs continuously in the cells.

In this process the consumed raw-material from food is called nutrition. Nutrition is obtained from different kind of foods.

Food is a combination of various energatic substance such as given below -

- (i) Carbohydrate - which are organic energy producer.
- (ii) Protein - which are organic body builder.
- (iii) fat - which are organic fuel substance.
- (iv) Vitamin - which are organic metabolic regulators.
- (v) Minerals - which are inorganic metabolic regulators.
- (vi) Water - which is inorganic metabolic regulators.
- (vii) Nucleic acid - which are organic heridity substances.

### → Food Security :-

Food Security refers to the availability of food and once's early excess to eat. There are two kinds of in-sufficiency

- 1) Under nourishment
- 2) Malanourishment.

Date.....

## 1) Undernourishment :-

Undernourishment lack of sufficient calories in available food.

Effects of undernourished food on human beings are the following.

- (i) less energy in the body for doing any kind of work.
- (ii) Body becomes weak and fall sick.
- (iii) An adult may look like an old man.

## 2) Malnutrition :-

depending on the degree of undernourishment children may suffer with one or more of the following problem.

- (i) slow body growth
- (ii) mainly retarded.
- (iii) illness such as anaemia, goiter, thyroide etc.
- (iv) abnormalities like - weakness, decolorization, decoloration of hair.

## 2) Malnutrition :-

Malnutrition is the lack of specific components of food, such as protein, vitamins or essential chemical elements. Some of the major problems of malnutrition are -

- (i) Kwashiorkor → lack of sufficient protein in diet.

Date.....

(ii) Anaemia → lack of iron.

→ Shelter Security

A basic structure or building that covers or provides protection is called shelter.

Cause of homelessness :-

- (i) Natural disaster
- (ii) Unemployment
- (iii) force eviction.
- (iv) Prison release and reentry into society.

Problem face by homeless people :-

Homeless people face many problems beyond the lack of a safe and suitable home. They faced many faced many social disadvantage and reduce access to private and public services such as -

- (i) Discrimination
- (ii) Reduce access to health care
- (iii) Increased risk of suffering from violence and abuse

## \* Economic Security and unemployment:-

By economic Security we mean regular in flow - of money, Accumulation of wealth and availability of resources which keep the wealth generation.

The economic Security may be expressed in term of courage, wealth now material etc.

it strong economic security to an individual, society or a nation. mix them confident, optimistic (optimist) and of prosperities in thinking.

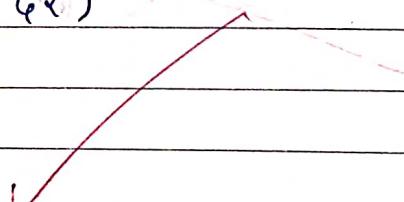

## \* Assessment of the economic strength of a country:-

the economic activities and growth of a nation can be measured in a number of ways.

- (i) Gross domestic product (G.D.P.)
- (ii) Exchange rates of its own currency with the foreign currency.
- (iii) Interest rate
- (iv) National Debt & Debt.
- (v) Rate of inflation (Hausar)
- (vi)

## \* Unemployment:-

X X X X X X X X

Unemployment is a measure of hindrance (barrier) in the development of a country.

→ Effects of unemployment :-

- (i) loss of self-confidence
- (ii) Suffer from mental strains, depression, Psychological anxiety.
- (iii) Generally hard kept of having a home, health care etc.
- (iv) Unemployment person are unable to earn livelihood, do not have money to meet their financial obligation.

\* Social Security :-

Society is a group of individuals. It assimilates young and old people, healthy and disable people, man and women etc. Each of these require social security for safe and peaceful living.

Social security means protection against insecure condition. Examples of different segments of society and their insecure condition are of the following.

Date.....

## Segments of Society & type of insecure conditions

1.) Poor people	1.) poverty
2.) Old age people	2.) inability of work
3.) Widow women	3.) Social abuse and economic
4.) Working women	4.) social abuse
5.) Unemployment youth	5.) work and earning.

### → Other categories of youth :-

6.) Destitute woman	6.) Social abuse and economic
7.) Mostly untaught people	7.) Negligible work ability
8.) Marriagable girl's	8.) Social abuse and maintenance.
9.) Orphan children	9.) care, education and health.
10.) Disabled people	10.) Constraint work ability

Social security to these people is generally being provided by means of social welfare services such as given below -

### (i) Social life Insurance.

- (i) Children insurance plan
- (ii) Retirement pension plan.
- (iii) Group insurance plan.
- (iv) Disability insurance.

~~objectives~~ 2.) Providing Basic Amenities such as -

- (i) Shelter
- (ii) food
- (iii) Education
- (iv) clothing
- (v) Medical care.

3.) Categorical (Universal) Benefits such as -

- (i) public pension
- (ii) old age pension
- (iii) Widow pension.

\* family welfare program :- A social sec security measure.

Caring for the welfare of families, their women, children and other members is an essential task. Of good health and better education is also necessary for their welfare. In this regard, many welfare programs are being implemented by various agencies.

→ Aims and objects :-

It aims at improving the quality of life and leaving the following objects. Hence, it advocates follow-

- (i) Two children per family.
- (ii) Good health to each one.
- (iii) Child Survival
- (iv) Literacy and education to all

### \* Agriculture →

Agriculture is one of the oldest professions in the world. It is also the largest sector.

Livelihood of majority of people in the world is agriculture dependent. There have broad changes in the environment along which are of the following nature.

#### → i) local change →

The changes that take place at the side of farming are called local changes. The nature of such changes are

- (i) Erosion of soil
- (ii) Fertilizer and pesticide mixed sediments
- (iii) Mixed pollutants pollutes the nearby water bodies.
- (iv) Fisheries are destroyed due to polluted toxic sediments.

## → 2) Regional changes →

As when the changes extend over large area beyond local surrounding, it is referred as regional changes. The effects of regional changes are -

- (i) Pollution at a larger scale.
- (ii) Alteration in fertility of soil.
- (iii) Desertification, land converted into Desert.
- (iv) Increasing deforestation

## → 3) Global changes →

Such changes occur across the globe on the entire earth. The nature of changes are as follows -

- (i) change in climate
- (ii) changes in chemical cycles - such as - oxygen cycle,  $\text{CO}_2$ ,  $\text{NO}_x$  - cycles.

## \* 4) Changes cause by overgrazing

Continuous overgrazing reduces input of soil organic matter because less plant biomass is available as litter, which in turn, reduces soil organic matter, nutrients, and biotic activity. This leads to deteriorated soil structure, which increases the potential for erosion and reduces water-holding capacity of soil.

# (Industry)

The industries are backbone of economy development and prosperity of a country and its people, yet it is the cause of measure concern for environmental and deterioration. Agriculture are responsible for the following consequences.

- 1.) They pollute air, water and soil. Because acid
- 2.) They cause acid rain.
- 3.) They cause climate changes.
- 4.) They cause adverse disease and ill effects.

## \* Mining :-

Minerals in use-able form are obtain after mining and many stages of processing. These have considerable effects on environment and its air, water, land, biological species.

### → Effects on air →

- 1.) Emission of dust, suspended particles and gases cause air pollution.

2.)

### → Effects on water →

- 1.) Surface water is polluted due to release of harmful trace elements.

→ Effects on soil →

(1) fertility of soil is lost.

(2) quality of soil degrades.

(3) Soil gets toxic.

→ Effects on vegetation →

(1) Growth of vegetation is adversely affected due to trace elements.

(2) Deforestation causes loss of flora and fauna.

→ Effects on biological species →

(1) The species are killed due to toxicity of water, air or soil.

(2) Stability of ecosystem is effected.

→ Social Impact of Large scale mining

- 1.) For construction of houses, the forest are demolished.
- 2.) Peace and quietness of people living in nearby locality.
- 3.) The wild life in surrounding areas may be endangered.
- 4.) Increased urbanization will result in enhanced pollution of water, soil etc.
- 5.) Air pollution will also increase due to dust, dirt from the account of construction activity.

Date.....

## Transportation

With increasing industrialization and organization the transportation activities have also increased many fold, by transportation activities we mean

- (i) Transport infrastructure such as construction of road. National highway, state highway, city road, village road.
- (ii) Transport auto vehicle such as car, bus, truck, motorcycle and other heavy vehicle.
- (iii) Marine transportation such as those ship and submarine etc.

→ Effects of marine transportation →

Pollution is a global problem. Some marine pollution problems are local in nature, but many have global implication.

→ Effects of marine pollution →

Main effects of marine pollution are of the following -

- (i) It destroys the ocean's food sources.
- (ii) It poses threat to flora and fauna.
- (iii) Sea fishes, animals, birds and other living organism are killed by oil leakage.
- (iv) It destroyed the marine life and disturbed the marine ecosystem.

Date.....

→ Sources of marine pollution →

following are measures sources of marine pollution.

- (i) Oil spilling
- (ii) water disposal.

→ Causes of marine pollution →

leaked

- (1) sunken oil tankers and ship.
- (2) Industrial waste flowing through rivers into the sea.
- (3) Oil from some man keepage
- (4) Natural decay of marine plants and animal life.

→ Environmental Impact Assessment :-

Environmental Impact Assessment is a tool used to assess the significant effects of a project or development proposal on the environment impact assessment aims that project decision maker think about the likely effect on environment at the earliest possible time and aim to avoid reduce or those effect.

→ History of EIA :-

The environmental impact assessment comes from section 102(2) of the national environmental policy act (NEPA), 1969 (USA).

## → EIA Legal provision :-

In India EIA was makes mandatory 1994 under the environment protection act of 1986 with the following four objectives.

- 1.) Predict environmental impact of projects.
- 2.) Find ways and means to reduce adverse impact.
- 3.) Save the project to suit local environment.
- 4.) Present the prediction and option to the decision making.

## → EIA Procedure :-

The EIA process in India consist the following phases.

### 1.) Project Proposal →

The project proposal shall include all relevant information available including a land in order to move the next stage.

### 2.) Screening →

Identification of significant impact, identification of public interest and values.

### 3.) Scoping →

The public can contribute local knowledge and

Date.....

values to the prediction, evaluation and mitigation.

4) Baseline data → information sometimes need before project implementation can be undertaken and reported.

Baseline data describe the existing environmental status of identify study area.

5) Assessment :-

Improvement in quality and acceptability of EIA report.

6) EIA Report :-

Public contribute to evaluation of quality and accepting of report.

7) Monitoring :-

Public evaluate impact that occur and support project environmental management process.

8) Sustainable development :-

Sustainable development is define as meeting the needs of the present without compromise the ability of future generation to meet their own needs.

The necessary condition for achieving sustainable development.

Date.....

(i) Social equity :-

There should be an equilibrium condition in the society among the same generation and b/w two different generations we should hand over a safe, healthy environment to our future generation.

(ii) eco-nomical equity :-

The technology should address to the problem of the above-leaving countries producing drought (RR). This type of technological development will support the economic growth of the poor countries.

(iii) ecological security :-

If any development process protect our biodiversity, decrease the rate of soil erosion and increase the forest cover area, that brings the ecological security.

\* Objectives of sustainable development :-

- (i) It should protect our biodiversity
- (ii) It should prevent soil erosion
- (iii) It should increase forest cover
- (iv) It should bring benefits to all
- (v) It should reduce waste generation.
